PERIODS IN QUATERNION SQUARE COMPLEX GROUPS

DIEGO RATTAGGI

Let (p,l) be any pair of distinct odd prime numbers. Let $x = x_0+x_1 i+x_2 j+x_3 k \in \mathbb{H}(\mathbb{Z}) \setminus \{0\}$. Define

$$\psi_{p,l} : \mathbb{H}(\mathbb{Z}) \setminus \{0\} \to \mathrm{PGL}_2(\mathbb{Q}_p) \times \mathrm{PGL}_2(\mathbb{Q}_l)$$

by

$$\psi_{p,l}(x) = \left(\begin{pmatrix} x_0 + x_1 c_p + x_3 d_p & -x_1 d_p + x_2 + x_3 c_p \\ -x_1 d_p - x_2 + x_3 c_p & x_0 - x_1 c_p - x_3 d_p \end{pmatrix}, \right.$$
$$\left. \begin{pmatrix} x_0 + x_1 c_l + x_3 d_l & -x_1 d_l + x_2 + x_3 c_l \\ -x_1 d_l - x_2 + x_3 c_l & x_0 - x_1 c_l - x_3 d_l \end{pmatrix} \right),$$

where $c_p, d_p \in \mathbb{Q}_p$ and $c_l, d_l \in \mathbb{Q}_l$ are elements such that $c_p^2 + d_p^2 + 1 = 0$ and $c_l^2+d_l^2+1 = 0$. Note that $\psi_{p,l}(xy) = \psi_{p,l}(x)\psi_{p,l}(y)$, $\psi_{p,l}(\lambda x) = \psi_{p,l}(x)$ if $\lambda \in \mathbb{Z}\setminus\{0\}$, and $(\psi_{p,l}(x))^{-1} = \psi_{p,l}(\overline{x})$, where $\overline{x} = x_0 - x_1 i - x_2 j - x_3 k$ is the conjugate of x. Define the norm $|x|^2 = x\overline{x} = \overline{x}x = x_0^2 + x_1^2 + x_2^2 + x_3^2$.

Let

$$\tilde{\Gamma}_{p,l} = \{x \in \mathbb{H}(\mathbb{Z}) ; \quad |x|^2 = p^r l^s, r, s \geq 0 ;$$
$$x_0 \text{ odd}, x_1, x_2, x_3 \text{ even, if } |x|^2 \equiv 1 \pmod 4 ;$$
$$x_1 \text{ even}, x_0, x_2, x_3 \text{ odd, if } |x|^2 \equiv 3 \pmod 4)\}.$$

Define subsets $\tilde{\Gamma}_p := \{x \in \tilde{\Gamma}_{p,l} : |x|^2 = p\}$ and $\tilde{\Gamma}_l := \{x \in \tilde{\Gamma}_{p,l} : |x|^2 = l\}$. Note that $|\tilde{\Gamma}_p| = 2(p+1)$ and $|\tilde{\Gamma}_l| = 2(l+1)$. Define $A_p = \{a_1, \ldots, a_{\frac{p+1}{2}}\}^{\pm 1} = \psi_{p,l}(\tilde{\Gamma}_p)$, $B_l = \{b_1, \ldots, b_{\frac{l+1}{2}}\}^{\pm 1} = \psi_{p,l}(\tilde{\Gamma}_l)$ and the group $\Gamma_{p,l} = \psi_{p,l}(\tilde{\Gamma}_{p,l})$ which is generated by $\{a_1, \ldots, a_{\frac{p+1}{2}}, b_1, \ldots, b_{\frac{l+1}{2}}\}$.

We associate to $\Gamma_{p,l}$ a set of squares ("tiles")

$$T(\Gamma_{p,l}) = \{aba'b' : a, a' \in A_p;\ b, b' \in B_l;\ aba'b' = 1 \in \Gamma_{p,l}\}.$$

We want to define a map $\mathrm{per} : A_p \times B_l \to \mathbb{N}_0$. Fix $(a,b) \in A_p \times B_l$. Then there is a unique pair $(a', b') \in A_p \times B_l$ such that $aba'b' = 1 \in \Gamma_{p,l}$, in particular

$$|T(\Gamma_{p,l})| = |A_p| \cdot |B_l| = (p+1)(l+1).$$

If $a' = a$ or $b' = b$, define $\mathrm{per}(a,b) = 0$.

If $a' \neq a$ and $b' \neq b$, then there is a unique tiling of the plane $f_{(a,b)} : \mathbb{Z}^2 \to T(\Gamma_{p,l})$, such that $f_{(a,b)}(i,i) = aba'b'$ for all $i \in \mathbb{Z}$. In this case define

$$\mathrm{per}(a,b) = \min\{j \in \mathbb{N} : f_{(a,b)}(i, i+j) = aba'b' \text{ for all } i \in \mathbb{Z}\}$$

and its multiplicity (divided by 4)

$$\mathrm{mult}_{p,l}(\mathrm{per}(a,b)) = \frac{1}{4}|\{(\hat{a}, \hat{b}) \in A_p \times B_l : \mathrm{per}(\hat{a}, \hat{b}) = \mathrm{per}(a,b)\}|.$$

Date: July 2004.

We take the factor $\frac{1}{4}$, since

$$\mathrm{per}(a,b) = \mathrm{per}(a',b') = \mathrm{per}(a^{-1},b'^{-1}) = \mathrm{per}(a'^{-1},b^{-1}),$$

if $aba'b' = 1$.

In the following table, we list two rows for each pair (p,l) such that $2 < p < l < 100$: in the first row are the possible periods of pairs $(a,b) \in A_p \times B_l$, i.e. the elements of the set

$$\{\mathrm{per}(a,b) : (a,b) \in A_p \times B_l\}$$

and in the second row are the corresponding multiplicities $\mathrm{mult}_{p,l}(\mathrm{per}(a,b))$. Observe that the sum of the numbers in the second row is always $(p+1)(l+1)/4$.

There are 276 pairs (p,l) in the list.

If $p \neq 3$, then there is always a period dividing 4 in the list above. Therefore, we get the following corollary.

Corollary 1. *Let (p,l) be a pair of prime numbers such that $3 < p < l < 100$. Then there are $x, y \in \widetilde{\Gamma}_{p,l}$ such that $xy = yx$ and $|x|^2 = p^4, |y|^2 = l^4$.*

Note that $\mathrm{per}(a,b) = 1$ if and only if $ab = ba \in \Gamma_{p,l}$.
